

Table S4: Growth rates associated with secondary mutations (labeled A) found to interact non-multiplicatively with  $\rho^*$ . Growth rates  $\gamma$  are given in doublings/hour; the absolute epistasis  $\epsilon$  is calculated using Eq. S7, with a 95% confidence interval obtained via resampling of the posterior distribution of model parameters. Concentrations of ethanol, CML (chloramphenicol), and STP (streptomycin) were 5.5% (v/v), 1.875  $\mu\text{g/mL}$ , and 2.0  $\mu\text{g/mL}$ , respectively. †: Growth rates calculated using spline-based fitting; see Section 1 for details. ‡: Relative fitnesses obtained from competition experiments (see Section 1.9) thus, growth rates are omitted.

Media	Secondary mutation (A)	$\gamma_{\text{WT}}$	$\gamma_{\rho^*}$	$\gamma_A$	$\gamma_{A,\rho^*}$	$\epsilon_{A,\rho^*}$ (95% CI)
